

Just one teaspoon of our powder can prevent caking in 400 teaspoons of your powder.

It only takes a little SYLOID anti-caking silica to keep a lot of powder dry and free-flowing. It traps moisture in millions of internal pores while its finely-divided particles cling to your particles to prevent caking caused by compression and tackiness. SYLOID is accepted by

the FDA and meets NF (USP) and FCC requirements. So whatever kind of powder you're producing, add 0.25 to 1.0% of SYLOID silica to streamline production and boost shelf life.
